

# Touch Sensitive code lock 22PS (812S/WP)

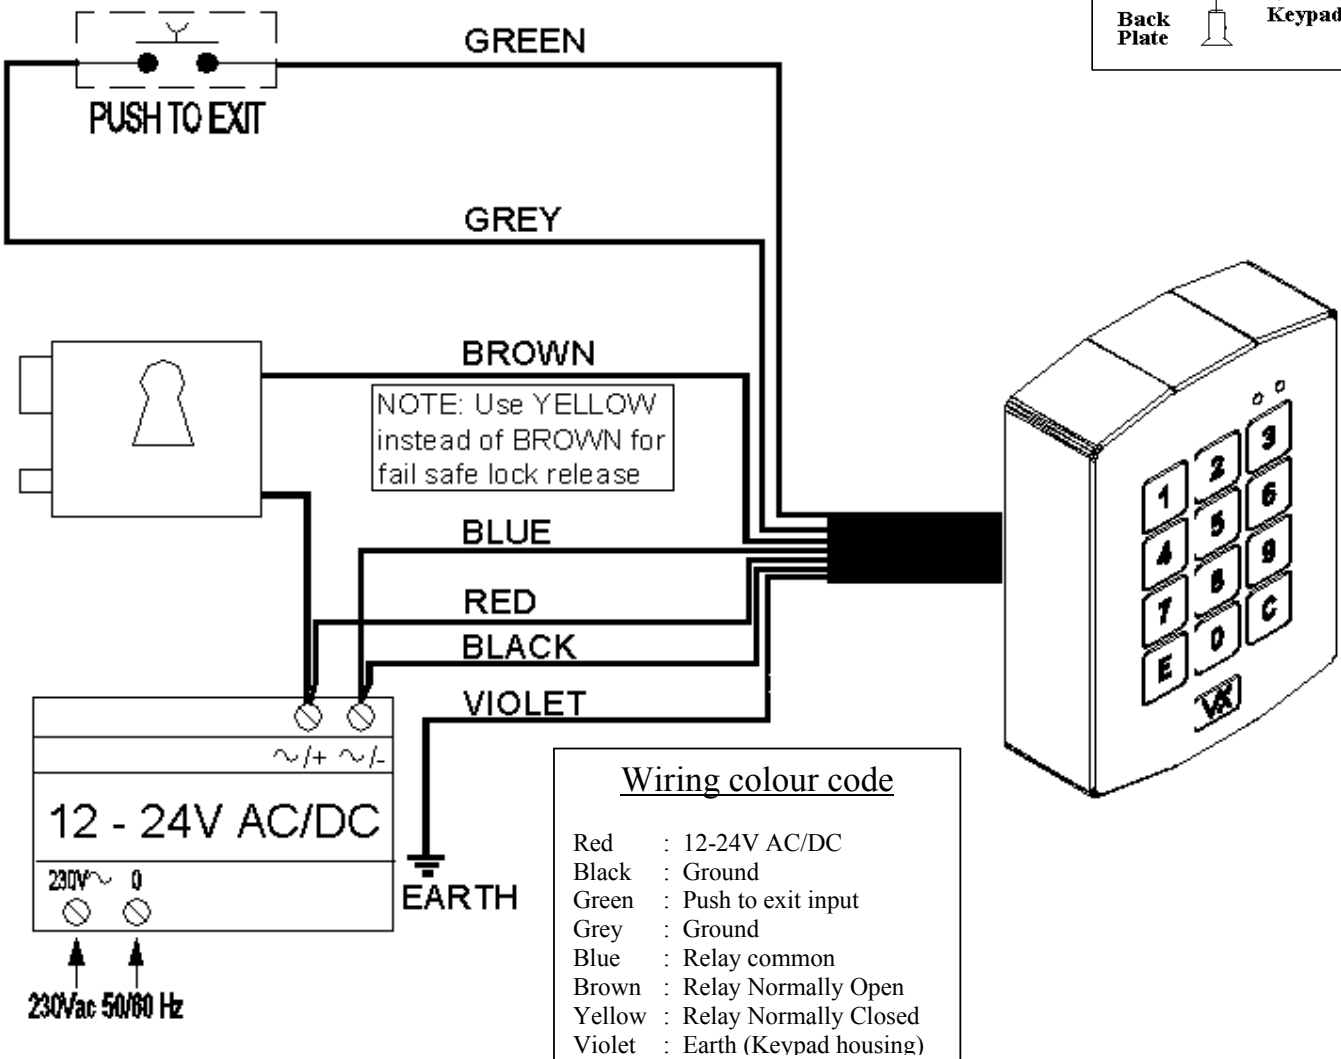

The 22PS is a self contained code lock capable of accepting up to 9 unique codes from 4 – 8 digits in length. The output is via a dry contact change over relay which can be programmed to activate from 01 – 99 seconds or latch by entering a relay time of ‘00’ during programming. (Note: When using the relay latching facility, to activate the relay enter the access code followed by ‘E’ and to de-activate the relay enter the access code followed by ‘C’). The code lock will operate from 12V to 24V AC or DC and includes a push to exit button input.

## Installation

Remove the fixing screw from the bottom of the keypad. This will allow the keypad and back plate to be separated. Fix the back plate to the wall using the fixing holes provided. Drill a hole through the wall to cater for the connection cable. Re-fit the keypad onto the back plate and secure using the screw provided.

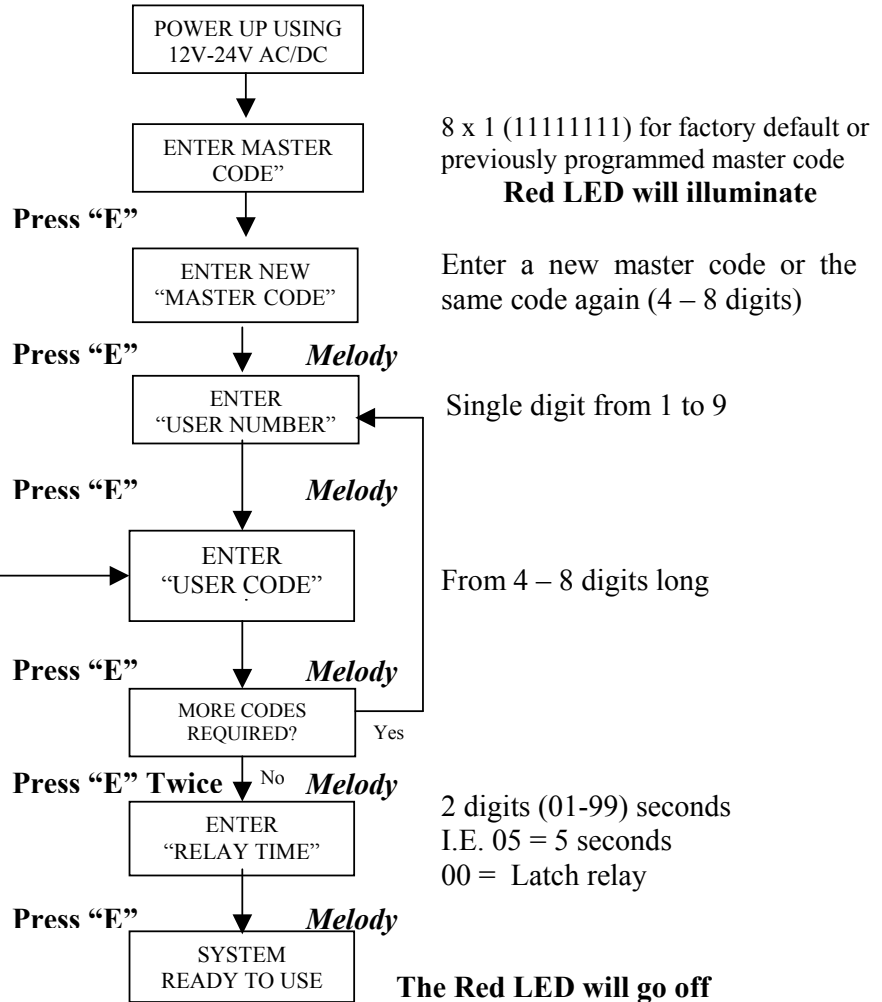

## Wiring

## Programming

User Nr.	NAME
1	
2	
3	
4	
5	
6	
7	
8	
9	

Press the "C" button to cancel the user code

## Programming Notes

- The access codes can be from 4 – 8 digits long
- Up to 9 access codes can be added to the codelock
- The relay time can be from 01 – 99 seconds or latching (00)
- The master code cannot activate the relay, it is only used to access the programming menu. (The master code must be different to any of the relay codes).
- It is good practice to keep a record of the user number and the name of the person/group who are using that code for future modification of codes/users.

## Operation

- To activate the relay simply type in the relevant code followed by 'E'. If the code is correct the relay will activate and the green LED will illuminate, if the code is incorrect a short melody will play (The melody will increase in length the more times an incorrect code is used consecutively).
- If a mistake is made when entering the code simply press 'C' and start again.
- If an access code is started and then left, the codelock will reset after 10 seconds (A beep will be heard from the codelock)
- To deactivate the relay when the relay time is set to latch (Relay time = '00') simply enter the code and press 'C'.

22PSVer1.0
